

# **FLORIDA DEPARTMENT OF HEALTH**

PHENOTYPIC ANTIMICROBIAL SUSCEPTIBILITY  
TESTING FOR *MYCOBACTERIUM TUBERCULOSIS*

Presentation by

Patrick Valois, BS, MT (AAB)

Medical Laboratory Scientist IV

Bureau of Public Health Laboratories

Florida Department of Health

JULY 2022

# GLOSSARY

---

- MIC—Minimum Inhibitory Concentration
- AST—Antimicrobial Susceptibility Testing
- MTB—*Mycobacterium tuberculosis*
- MDR—Multidrug resistant
- XDR—Extensively drug resistant

# OVERVIEW

---

- Practical Aspects of Implementing a Microdilution AST System
- Florida's Experience with Microdilution AST
- Developing a Customized Sensititre<sup>®</sup> panel to Meet Clinicians' Needs

# PRACTICAL ASPECTS OF IMPLEMENTING A MICRODILUTION AST SYSTEM

---

Will this be your laboratory's only antimicrobial susceptibility test?

- Provides more information to treating clinicians
- Turn-around time 14–21 days after setup from pure MTB growth on solid media
- Robust molecular-based prediction of antimicrobial resistance recommended

# PRACTICAL ASPECTS OF IMPLEMENTING A MICRODILUTION AST SYSTEM (CONTINUED)

---

Which antimicrobial drugs will the laboratory be testing?

- Which drug regimens are the clinicians in your state considering?
- What will be the range of concentrations tested?
- How will the results be reported and interpreted?

# PRACTICAL ASPECTS OF IMPLEMENTING A MICRODILUTION AST SYSTEM (CONTINUED)

Equipment—Florida's implementation of the Sensititre<sup>®</sup> system:

- Inoculum
- Inoculation method
- Incubation
- Reading Method

Sensititre Equipment, Courtesy of Patrick Valois

# FLORIDA'S EXPERIENCE WITH MICRODILUTION AST

Common issues to consider when interpreting Sensititre® plates:

- Trailing—Precipitate or media carry over that is indicated by the presence of pellets in several wells with the same size and density.  
Most often seen with Linezolid and Para-aminosalicylic acid.
- Skips—A well without growth bordered by wells showing growth.  
One skip may be ignored.
- Air bubbles—Form in broth media and may appear as growth.

Sensititre plate, Courtesy of Mycobacteriology Laboratory

Skip Example, Courtesy of Mycobacteriology Laboratory

# FLORIDA'S EXPERIENCE WITH MICRODILUTION AST (CONTINUED)

---

Troubleshooting common issues:

- An inverted microscope can be used to differentiate growth from trailing or air bubbles.
- When two or more skipped wells are present, the culture used for setup is checked for contamination. If the culture is not found to be contaminated, repeat testing is performed.

# FLORIDA'S EXPERIENCE WITH MICRODILUTION AST (CONTINUED)

---

Whenever phenotypic results do not match genotypic prediction, results are confirmed by a second technologist.

Common causes:

- Low level rifampin-resistance mutations
- Mutations outside commonly-tested molecular targets
- Heteroresistance not detected by molecular methods
- Fluoroquinolone monoresistance

# DEVELOPING A CUSTOMIZED SENSITITRE<sup>®</sup> PANEL TO MEET CLINICIANS' NEEDS

---

Design—Meeting with Medical Director, TB Physician's Consultation Network

- Antimicrobial drugs requested
  - Meropenem
  - Clofazimine
  - Bedaquiline
  - Rifapentine
  - Pretomanid or Delamanid
- Antimicrobial drugs removed from current panel
  - Rifabutin
  - Amikacin
  - Streptomycin
  - Capreomycin

# DEVELOPING A CUSTOMIZED SENSITITRE PANEL TO MEET CLINICIANS' NEEDS (CONTINUED)

Table 2 New Sensititre® Custom Panel

Table Key  
 CPS–Capreomycin  
 MXF–Moxifloxacin  
 RIF–Rifampin  
 AMI–Amikacin  
 STR–Streptomycin  
 RFB–Rifabutin  
 PAS–Para-aminosalicylic acid  
 LZD–Linezolid  
 CYC–Cycloserine  
 INH–Isoniazid  
 LEVO–Levofloxacin  
 EMB–Ethambutol  
 CFZ–Clofazimine  
 RFP–Rifapentine  
 BDQ–Bedaquiline  
 MR/C–Meropenem and Clavulanic acid

# DEVELOPING A CUSTOMIZED SENSITITRE PANEL TO MEET CLINICIANS' NEEDS (CONTINUED)

## Design—Antimicrobial drug specifications

| Antimicrobial drug             | Range (µg/ml)  | Interpretive criteria |           |
|--------------------------------|----------------|-----------------------|-----------|
|                                |                | Susceptible           | Resistant |
| Bedaquiline                    | 0.015–2.0      | ≤0.25                 | ≥0.5      |
| Clofazimine                    | 0.015–2.0      | ≤0.25                 | ≥0.5      |
| Rifapentine                    | 0.06–8.0       | -                     | -         |
| Meropenem with Clavulanic acid | 0.5/2.5–64/2.5 | -                     | -         |

Table 3. Antimicrobial drug concentrations and interpretation

# DEVELOPING A CUSTOMIZED SENSITITRE PANEL TO MEET CLINICIANS' NEEDS (CONTINUED)

---

Collaboration—New York State Department of Health, Mycobacteriology Laboratory, Wadsworth Center

Testing 50 well-characterized isolates:

- 25 pan-susceptible strains, 15 MDR (including 5 low-level rifampin-resistant strains), 1 linezolid-resistant strain, 2 bedaquiline-resistant strains, 2 clofazimine-resistant strains and 5 XDR (or pre-XDR) strains
- Comparison of phenotypic results with WGS genotypic results
- Interlaboratory reproducibility
- Frozen panel versus lyophilized panel for antimicrobial drugs common to both

# DEVELOPING A CUSTOMIZED SENSITITRE PANEL TO MEET CLINICIANS' NEEDS (CONTINUED)

---

## Goal:

Validate the use of a new customized panel which incorporates the antimicrobial drugs that may be used in new and future drug regimens for the treatment of *Mycobacterium tuberculosis*.

# CONCLUSION

---

Updating our antimicrobial susceptibility testing to meet the new drug regimens that are being utilized by clinicians to treat *Mycobacterium tuberculosis* is essential. As *Mycobacterium tuberculosis* resistance continues to evolve, so too must our methods detect and combat it.
